Write your Centre number, candidate number and name on all the work you hand in.
Give details of the practical session and laboratory where appropriate, in the boxes provided.
Write in dark blue or black pen.
You may use an HB pencil for any diagrams or graphs.
Do not use staples, paper clips, glue or correction fluid.
DO NOT WRITE IN ANY BARCODES.
Answer all questions.
Electronic calculators may be used.
You may lose marks if you do not show your working or if you do not use appropriate units.
Use of a Data Booklet is unnecessary.
Qualitative Analysis Notes are printed on pages 10 and 11.
At the end of the examination, fasten all your work securely together.
The number of marks is given in brackets [ ] at the end of each question or part question.

This document consists of 11 printed pages and 1 blank page.
In this question you will determine the concentration of iron(II) ions in FA 2. To do this you will do a titration using potassium manganate(VII) solution. The iron(II) ions, Fe^{2+}, are oxidised by the manganate(VII) ions, MnO_4^-.

\[ 5\text{Fe}^{2+}(aq) + \text{MnO}_4^-(aq) + 8\text{H}^+(aq) \rightarrow 5\text{Fe}^{3+}(aq) + \text{Mn}^{2+}(aq) + 4\text{H}_2\text{O}(l) \]

When all the Fe^{2+} ions have been oxidised, the presence of unreacted MnO_4^- ions causes the solution to become a permanent pink colour.

FA 1 contains 0.0200 mol dm^{-3} manganate(VII) ions, MnO_4^-.
FA 2 is a solution containing iron(II) ions, Fe^{2+}.
FA 3 is 1.0 mol dm^{-3} sulfuric acid, H_2SO_4.

(a) Method

- Fill the burette with FA 1.
- Use the pipette to transfer 25.0 cm^3 of FA 2 into the conical flask.
- Use the 25 cm^3 measuring cylinder to add 10 cm^3 of FA 3 to the conical flask.
- Add FA 1 from the burette into the conical flask until the solution becomes a permanent pink colour.
- Perform a rough titration and record your burette readings in the space below.

The rough titre is ...................... cm^3.

- Do as many accurate titrations as you think necessary to obtain consistent results.
- Make certain any recorded results show the precision of your practical work.
- Record in a suitable form below all of your burette readings and the volume of FA 1 added in each accurate titration.

Keep FA 2 to use in Question 3.
(b) From your accurate titration results, obtain a suitable value to be used in your calculations. Show clearly how you obtained this value.

25.0 cm$^3$ of FA 2 required ......................... cm$^3$ of FA 1. [1]

(c) Calculations

Show your working and appropriate significant figures in the final answer to each step of your calculations.

(i) Calculate the number of moles of manganate(VII) ions present in the volume of FA 1 calculated in (b).

moles of MnO$_4^-$ = ......................... mol

(ii) Calculate the number of moles of iron(II) ions present in 25.0 cm$^3$ of FA 2.

moles of Fe$^{2+}$ = ......................... mol

(iii) Calculate the concentration, in mol dm$^{-3}$, of iron(II) ions in FA 2.

concentration of Fe$^{2+}$ in FA 2 = ......................... mol dm$^{-3}$

(iv) FA 2 was prepared by dissolving hydrated ammonium iron(II) sulfate, (NH$_4$)$_2$Fe(SO$_4$)$_2$.6H$_2$O in distilled water. Calculate the mass of salt that would have to be dissolved in 1.00 dm$^3$ of water to prepare FA 2.

(A: H, 1.0; N, 14.0; O, 16.0; S, 32.1; Fe, 55.8)

mass of (NH$_4$)$_2$Fe(SO$_4$)$_2$.6H$_2$O = ......................... g

[Total: 12]
2 In this experiment you will measure the heat given out by the reaction of excess zinc with copper(II) sulfate solution and use this to estimate the concentration of the copper(II) sulfate.

\[ \text{Zn(s) + CuSO}_4\text{(aq)} \rightarrow \text{ZnSO}_4\text{(aq) + Cu(s)} \]

**FA 4** is zinc powder.  
**FA 5** is aqueous copper(II) sulfate, CuSO₄.

(a) Method

Read through the instructions carefully and prepare a table below for your results before starting any practical work.

- Support the plastic cup in the 250 cm³ beaker.
- Use the 50 cm³ measuring cylinder to transfer 40 cm³ of **FA 5** into the plastic cup.
- Measure and record the initial temperature of the solution in the plastic cup.
- Start the stopwatch. Measure and record the temperature of the solution every 30 seconds up to and including the temperature at 2 minutes. Stir the solution frequently.
- At time \( t = 2\frac{1}{2} \) minutes, add all the powdered zinc to the solution in the plastic cup and stir the mixture.
- Record the temperature every 30 seconds from \( t = 3 \) minutes up to and including \( t = 9 \) minutes. Stir the solution constantly.

(b) (i) On the grid opposite, plot the temperature (y-axis) against the time (x-axis). The scale for the temperature axis must allow you to plot a point with a temperature 5°C greater than the maximum temperature you recorded.

(ii) Draw the following best-fit straight lines on the graph.

- a line through the points between time \( t = 0 \) minutes and time \( t = 2 \) minutes
- a line through the points between time \( t = 5 \) minutes and time \( t = 9 \) minutes
- a vertical line at time \( t = 2\frac{1}{2} \) minutes

(iii) Extrapolate the first two straight lines so that they intersect the vertical line at time \( t = 2\frac{1}{2} \) minutes.  
Use these extrapolated lines to determine the theoretical temperature change at time \( t = 2\frac{1}{2} \) minutes.

change in temperature = .......... °C
(c) Calculations

Show your working and appropriate significant figures in the final answer to each step of your calculations.

(i) Use your answer to (b)(iii) to calculate the heat energy produced in the reaction. (Assume that 4.2 J are required to increase the temperature of 1 cm³ of solution by 1 °C.)

heat energy produced = .................................... J

(ii) The molar enthalpy change, \( \Delta H \), for the reaction shown below is –219 kJ mol⁻¹.

\[
\text{Zn(s)} + \text{CuSO}_4(\text{aq}) \rightarrow \text{ZnSO}_4(\text{aq}) + \text{Cu(s)}
\]

Use this value and your answer to (i) to calculate the number of moles of copper(II) sulfate in your reaction.

moles of CuSO₄ = .................................... mol

(iii) Use your answer to (ii), to calculate the concentration of copper(II) sulfate, in mol dm⁻³, in FA 5.

concentration of CuSO₄ = ............................. mol dm⁻³

(d) (i) Calculate the maximum percentage error in the highest temperature that you recorded in your results table.

maximum percentage error = ............................. %

(ii) A student suggested that the concentration of the copper(II) sulfate could be determined more accurately if a greater mass of zinc had been used. Explain whether you agree with this student.

.............................................................................................................................

.............................................................................................................................

.............................................................................................................................

(iii) A second student suggested that the concentration of the copper(II) sulfate could be determined more accurately if a smaller volume of copper(II) sulfate was used. Explain whether you agree with this student.

.............................................................................................................................

.............................................................................................................................

.............................................................................................................................

3 Qualitative Analysis

At each stage of any test you are to record details of the following.

- colour changes seen
- the formation of any precipitate
- the solubility of such precipitates in an excess of the reagent added

Where gases are released they should be identified by a test, described in the appropriate place in your observations.

You should indicate clearly at what stage in a test a change occurs. Marks are not given for chemical equations. No additional tests for ions present should be attempted.

If any solution is warmed, a boiling tube MUST be used.

Rinse and reuse test-tubes and boiling tubes where possible.

Where reagents are selected for use in a test, the name or correct formula of the element or compound must be given.

(a) In Question 1 you used FA 2. This solution was prepared from hydrated ammonium iron(II) sulfate, (NH₄)₂Fe(SO₄)₂·6H₂O.

To a 1 cm depth of FA 2 in a test-tube, add a small spatula measure of sodium carbonate.

Record your observations.

................................................... [2]

Solutions containing Fe²⁺ ions can quickly be oxidised in air if they are prepared by dissolving the solid in distilled water.

Use your observations to suggest what other substance was added to solid (NH₄)₂Fe(SO₄)₂·6H₂O to prepare FA 2.

...................................................
(b) **FA 6** is a mixture of two salts, each of which contains a single cation and a single anion from those listed in the Qualitative Analysis Notes on pages 10 and 11. Do the following tests and record your observations in the table below.

<table>
<thead>
<tr>
<th>test</th>
<th>observations</th>
</tr>
</thead>
<tbody>
<tr>
<td>(i) Place a small spatula measure of <strong>FA 6</strong> in a hard-glass test-tube and heat strongly.</td>
<td></td>
</tr>
<tr>
<td>(ii) Place a small spatula measure of <strong>FA 6</strong> in a test-tube and carefully add dilute sulfuric acid until the reaction is complete, then add aqueous sodium hydroxide.</td>
<td></td>
</tr>
<tr>
<td>(iii) To a 3 cm depth of distilled water in a boiling tube, add the remaining sample of <strong>FA 6</strong>. Stir and then filter the mixture into a clean boiling tube. You will use this solution for tests (iv)–(vi).</td>
<td></td>
</tr>
<tr>
<td>(iv) To a 1 cm depth of the solution from (iii) in a test-tube, add aqueous sodium hydroxide.</td>
<td></td>
</tr>
<tr>
<td>(v) To a 1 cm depth of the solution from (iii) in a test-tube, add aqueous ammonia.</td>
<td></td>
</tr>
<tr>
<td>(vi) To a 1 cm depth of the solution from (iii) in a test-tube, add aqueous barium chloride or aqueous barium nitrate.</td>
<td></td>
</tr>
</tbody>
</table>
(vii) Suggest possible identities for the ions present in FA 6.

cations ..................................................................................................................... ...........
anions ...................................................................................................................... ...........

(viii) Describe a further test that would allow you to determine exactly which anions are present. Explain your choice. Do **not** do this test.
