When light is incident on the front of a photocell, an e.m.f. is generated in the photocell.

A student wishes to investigate the effect of adding various thicknesses of glass in front of a photocell. This may be carried out in the laboratory by varying the number of identical thin glass sheets between a light source and the front of the photocell.

It is suggested that the e.m.f. \( V \) is related to the number \( n \) of glass sheets by the equation

\[
V = V_0 e^{-\alpha nt}
\]

where \( t \) is the thickness of one sheet, \( \alpha \) is the absorption coefficient of glass and \( V_0 \) is the e.m.f. for \( n = 0 \).

Design a laboratory experiment to determine the absorption coefficient of glass. You should draw a diagram, on page 3, showing the arrangement of your equipment. In your account you should pay particular attention to

(a) the procedure to be followed,

(b) the measurements to be taken,

(c) the control of variables,

(d) the analysis of the data,

(e) the safety precautions to be taken.

2 A student is investigating how a volume of nitrogen gas is affected by the pressure exerted on it.

A sample of nitrogen gas is trapped in a vertical tube of uniform cross-sectional area by a small volume of oil. Pressure is applied by a pump. The applied pressure is measured on a gauge, as shown in Fig. 2.1.

![Diagram of nitrogen gas in a vertical tube with a pump and a pressure gauge](image)

The temperature $T$ of the nitrogen is 290 K.

An experiment is carried out to investigate how the height $h$ of nitrogen trapped in the tube varies with the pressure $p$.

**Fig. 2.1**

*Question 2 continues on the next page.*
It is suggested that $p$ and $h$ are related by the equation

$$pAh = NkT$$

where $A$ is the cross-sectional area of the tube, $k$ is the Boltzmann constant and $N$ is the number of molecules of nitrogen gas.

(a) A graph is plotted of $p$ on the $y$-axis against $\frac{1}{h}$ on the $x$-axis. Express the gradient in terms of $N$.

\[
\text{gradient} = \frac{N}{A} \]

(b) Values of $p$ and $h$ are given in Fig. 2.2.

Fig. 2.2

Calculate and record values of $\frac{1}{h}$ in Fig. 2.2. Include the absolute uncertainties in $\frac{1}{h}$.

(c) (i) Plot a graph of $p/10^5$ Pa against $\frac{1}{h}/\text{m}^{-1}$. Include error bars for $\frac{1}{h}$.

(ii) Draw the straight line of best fit and a worst acceptable straight line on your graph. Both lines should be clearly labelled.

(iii) Determine the gradient of the line of best fit. Include the uncertainty in your answer.

\[
\text{gradient} = \frac{N}{A} \]
(d) In this experiment, \( A = 3.14 \times 10^{-6} \text{ m}^2 \) and \( k = 1.38 \times 10^{-23} \text{ JK}^{-1} \). Using your answer in (c)(iii), determine the value of \( N \). Include the absolute uncertainty in your value.

\[ N = \text{.................................................................}[2] \]

(e) (i) The pressure is reduced so that \( p = 1.10 \times 10^5 \text{ Pa} \) and the temperature decreases by \( 12 \pm 1 \text{ K} \).

Determine \( h \) using the relationship given and your answer in (d).

\[ h = \text{.................................................................}[2] \]

(ii) Determine the percentage uncertainty in your value of \( h \).

\[ \text{percentage uncertainty} = \text{...........................................................} \% [1] \]
